FindIT implemented features

Revised Iterations 1 and 2 | 3 November 2026 | GitHub main 7d075a4

The following features have been implemented for the revised scope. A found report starts as **Reported - Not Received**; it does not establish physical police receipt or custody.

Public and citizen features

01 Accounts. Registration, login, logout, email-confirmation handling, and citizen, officer and admin roles. New registrations receive the citizen role; any citizen can report a found item.

02 Lost and found reports. Create and edit reports with item details, date, location, required private contact information and optional private ownership clues.

03 Photo uploads. Private image storage, file-type and size validation, image decoding and resizing, and a selected-photo preview. Invalid images are rejected.

04 Report references and statuses. Unique report IDs and valid initial states. Found reports use Reported - Not Received in the interface; the database value remains pending_surrender.

05 Public discovery. Moderated listings and public detail pages, keyword search, category, area, type and status filters, clear-filter controls and empty states.

06 Station directory and locator. Approved demo station addresses, contacts and receiving hours; manual area search, optional GPS, estimated-distance sorting, map/directions and an address-list fallback.

07 Intended drop-off. Reporters can select an intended station. This remains separate from confirmed receipt and the station actually holding an item.

Demo data: All seeded stations and coordinates are fictional. No real police partnership or authorized receiving point is claimed.

Staff operations and foundations

Implementation continued

08 Staff permissions. Officers access private reports, photos, claims and custody events for their assigned station. Admins have explicit global access. Unassigned submissions require an admin.

09 Station management. Admins can create/edit demo stations, approve directory visibility, and maintain addresses, contacts, receiving hours, service areas and coordinates.

10 Physical item intake. Assigned officers explicitly confirm possession and record storage. Receipt creates a traceable intake reference, timestamp, staff ID and receiving station.

11 Custody and inventory. Move received items into custody, update storage, filter station inventory by reference/title or status, and view timestamped custody history. Release is not available yet.

12 Private ownership claims. Signed-in potential owners submit private text evidence and receive a claim reference. Duplicate claims are blocked; submission does not approve ownership.

13 Publication moderation. Staff approve/reject assigned reports and write safe public text. Pending, rejected and withdrawn reports stay hidden. Reporter edits require renewed approval.

14 Withdrawal and edit history. Reporters can withdraw public listings. Prior report snapshots, actor IDs and timestamps are retained under access controls; withdrawal does not erase custody.

15 Database and security. Supabase Auth, Postgres/PostGIS, migrations, private Storage, Row Level Security, protected fields and server-side authorization. Original descriptions, contact details and proof clues are excluded from public reads.

16 Codespaces support. Forwarded-host handling for Server Actions and public authentication redirects, with unrelated request origins still blocked.

17 Documentation and verification. Setup instructions, scope mapping, test checklist, seven automated unit/API tests, and transactional database permission/workflow tests. The build and TypeScript checks passed.

Deferred work

Claim approval/rejection, controlled item release, claimant tracking/history screens, matching/AI, alerts, notifications and later operational polish remain outside these two iterations.

Verification limit: New staff browser flows, GPS denial and external map rendering still require manual checks. Registration-email delivery to a real mailbox has not been verified.
